donation-service

donation-service Play App

- Rebuild simpler version of the donation play app:
 - No User Interface
 - No JPA relationships
- Includes:
 - Converters from Json to User/Donation and back

Models

```
@Entity
public class Donation extends Model
{
    public int    amount;
    public String method;

    public Donation (int amount, String method)
    {
        this.amount = amount;
        this.method = method;
    }

    public String toString()
    {
        return amount + ", " + method;
    }
}
```

```
@Entity
public class Donor extends Model
{
    public String firstName;
    public String lastName;
    public String email;
    public String password;

    public Donor(String firstName,
                  String lastName,
                  String email, String password)
    {
        this.firstName = firstName;
        this.lastName = lastName;
        this.email = email;
        this.password = password;
    }
}
```

Utils

```
@Global
public class GsonBinder implements TypeBinder<JsonElement>
{
    public Object bind(String name, Annotation[] notes, String value, Class toClass, Type toType) throws Exception
    {
        return new JsonParser().parse(value);
    }
}
```

- Utility class to enable controller actions to translate to/from Json objects.

JSON

<http://en.wikipedia.org/wiki/JSON>

JSON ([/ˈdʒeɪsən/](#) ***jay**-sawn*, [/ˈdʒeɪsən/](#) ***jay**-sun*), or **JavaScript Object Notation**, is a text-based [open standard](#) designed for [human-readable](#) data interchange. Derived from the [JavaScript](#) scripting language, JSON is a language for representing simple [data structures](#) and [associative arrays](#), called objects. Despite its relationship to JavaScript, JSON is [language-independent](#), with parsers available for many languages.

The JSON format was originally specified by [Douglas Crockford](#), and is described in [RFC 4627](#). The official [Internet media type](#) for JSON is `application/json`. The JSON filename extension is `.json`.

The JSON format is often used for [serializing](#) and transmitting structured data over a network connection. It is used primarily to transmit data between a server and web application, serving as an alternative to [XML](#).

```
{
  "name": "mocha",
  "shop": "costa",
  "rating": 3.5,
  "price": 2.0,
  "favourite": 0,
  "id": 1
},
{
  "name": "americano",
  "shop": "costa",
  "rating": 4.5,
  "price": 3.0,
  "favourite": 1,
  "id": 2
},
{
  "name": "cappuccino lite",
  "shop": "starbucks",
  "rating": 1.5,
  "price": 4.0,
  "favourite": 1,
  "id": 3
}
```

google-gson

Gson is a Java library that can be used to convert Java Objects into their JSON representation.

It can also be used to convert a JSON string to an equivalent Java object.

Gson can work with arbitrary Java objects including pre-existing objects that you do not have source-code of.

Goals

- Provide simple `toJson()` and `fromJson()` methods to convert Java objects to JSON and vice-versa
- Allow pre-existing unmodifiable objects to be converted to and from JSON
- Extensive support of Java Generics
- Allow custom representations for objects
- Support arbitrarily complex objects (with deep inheritance hierarchies and extensive use of generic types)

controllers

- Actions do not render any views
- Use 'renderJSON' to return json version of model objects
- Other responses include 'notFound' and 'Ok' - which are HTTP response codes

```
public class DonationServiceAPI extends Controller
{
    static Gson gson = new Gson();

    public static void getAllDonors()
    {
        List<Donor> Donors = Donor.findAll();
        renderJSON(gson.toJson(Donors));
    }

    public static void getDonor(Long id)
    {
        Donor donor = Donor.findById(id);
        if (donor == null)
        {
            notFound();
        }
        else
        {
            renderJSON(gson.toJson(donor));
        }
    }

    public static void createDonor(JsonElement body)
    {
        Donor donor = gson.fromJson(body.toString(), Donor.class);
        donor.id = null;
        donor.save();
        renderJSON(gson.toJson(donor));
    }
    ...
}
```

controllers

```
public class DonationServiceAPI extends Controller
{
    ...

    public static void deleteDonor(Long id)
    {
        Donor donor = Donor.findById(id);
        if (donor == null)
        {
            notFound("No Doner with ID" + id);
        }
        else
        {
            donor.delete();
            renderJSON(gson.toJson(donor));
        }
    }

    public static void deleteAllDonors()
    {
        Donor.deleteAll();
        renderText("success");
    }
}
```

Bootstrap

```
@OnApplicationStart
public class Bootstrap extends Job
{
    public void doJob()
    {
        if (User.count() == 0)
        {
            Fixtures.deleteDatabase();
            Fixtures.loadModels("data.yml");
        }
    }
}
```

```
User(homer):
  usaCitizen: true
  firstName: Homer
  lastName: Simpson
  email: homer@simpson.com
  password: secret
```

```
User(marge):
  usaCitizen: true

  method : paypal
```

```
Donation(b):
  amount : 20
  method : cash
```

```
Donation(c):
  amount : 330
  method : cash
```

Routes

GET	/api/donors	DonationServiceAPI.getAllDonors
GET	/api/donors/{id}	DonationServiceAPI.getDonor
POST	/api/donors	DonationServiceAPI.createDonor
DELETE	/api/donors/{id}	DonationServiceAPI.deleteDonor
DELETE	/api/donors	DonationServiceAPI.deleteAllDonors
GET	/api/donations	DonationServiceAPI.getAllDonations
GET	/api/donations/{id}	DonationServiceAPI.getDonation
POST	/api/donations	DonationServiceAPI.createDonation
DELETE	/api/donations/{id}	DonationServiceAPI.deleteDonation
DELETE	/api/donations	DonationServiceAPI.deleteAllDonations

- Donation Service API
- Client application use these patterns to communicate with service

Your application is ready ! x

localhost:9000

☆ ⌚ 💬 ☰

Your new application is ready!

Congratulation, you've just created a new play application. This page will help you in the few next steps.

Why do you see this page?

The **conf/routes** file defines a route that tell play to invoke the **Application.index** action when a browser requests the / URI using the **GET** method:

```
# Application home page
GET      /           Application.index
```

So play has invoked the **controllers.Application.index()** method:

```
public static void index() {
    render();
}
```

Using the **render()** call, this action asks play to display a template. By convention play has displayed the **app/views/Application/index.html** template:

```
{extends 'main.html' /}
{set title:'Home' /}
```

Play 1.2.7

Supercharge your API workflow with Postman!

Build, test, and document your APIs faster. More than a million developers already do.

The idea for Postman arose while the founders were working together, and were frustrated with the existing tools for testing APIs.
